FILIP BLAŽEKVIĆ TAKES ON THE ROLE OF CTO AT IDENTITYUM

Croatian regtech startup **Identity Consortium**, the company behind the comprehensive digital identity solution **Identityum**, has strengthened its technical leadership by appointing **Filip Blažeković** as Chief Technology Officer (CTO). Identityum enables businesses and citizens to securely identify themselves digitally, authenticate remotely, sign documents with legally valid electronic signatures, and automate financial data verification — all in compliance with eIDAS, GDPR, AML, and PSD2 regulations.

Filip is a software engineer with over **nine years of experience** in secure software development, who has been working at Identity Consortium since January 2021. Over nearly five years with the company, Filip has progressed from Senior Software Engineer to Lead Security Engineer, where he served as the **key technical force** behind building Identityum’s entire security infrastructure.

Under his leadership, the cryptographic infrastructure of the mobile authenticator was developed, hardware security modules (HSM) were implemented in data centers, and cryptographic libraries were built for Android and iOS platforms. Filip also holds the international security certifications CompTIA Security+ and CompTIA CySA+ (Cybersecurity Analyst), and previously gained experience in payment processing and financial systems.

“Over the years, Filip has demonstrated exceptional talent and dedication to building a secure and reliable technical foundation for Identityum. His expertise in development is extremely valuable for Identityum, which is building the trust infrastructure for digital identity. I am confident that in his role as CTO, he will take our services to an even higher level of security and technical excellence, positioning us as a trusted partner for companies and governments building the digital identity ecosystem.”

Robert Ilijaš, CEO at Identityum

“Identityum addresses one of the key challenges of digital transformation: how to ensure that digital identity is secure, legally valid, and under user control. The infrastructure we have built is based on the best cryptographic protection standards, and my goal is to continue this work and bring our services to a level that meets growing global requirements and regulations such as eIDAS.”

Filip Blažeković, CTO at Identityum

IDENTYUM

A comprehensive digital identity solution — a platform and digital ID wallet that enables businesses and citizens (end users) to easily and verifiably identify themselves in the digital world, to sign digital documents legally and efficiently using mobile devices, to securely store their personal data, and to maintain full control over that data.

IDENTITY CONSORTIUM d.o.o.

A Croatian technology start-up founded in 2018, focused on the digital transformation of society while respecting citizens' rights to personal data protection. It offers businesses seeking to digitally transform their operations tools for business digitalization, identity management, and citizen personal data management — ensuring maximum protection and full citizen control. It also offers tools for digital document signing and reliable financial data verification.
